As shown in FIG. 5 of the accompanying drawings, the split beam dynamo 62 is secured to a compressor rotor 61, and the output voltage of the split beam dynamo 62 is applied to an inverter 63. In order to prevent the output of the split beam dynamo 62 from switching over when the rotating speed of the compressor rotor 61 is low, the efficiency and the output current of the split beam dynamo 62 are changed in accordance with the rotating speed of the compressor rotor 61. While the rotating speed of the compressor rotor 61 is low, the output of the split beam dynamo 62 is controlled to maintain a predetermined constant output current, and while the rotating speed of the compressor rotor 61 becomes high, the output of the split beam dynamo 62 is controlled to increase its output current in accordance with the increase of the rotating speed. In this manner, the output of the split beam dynamo 62 is controlled in accordance with the rotating speed of the compressor rotor 61 so that the capacity of the rotary compressor is maintained at a constant value. However, the output of the split beam dynamo 62 is changed by the fluctuation of the tension in the winding of the armature coil of the split beam dynamo 62, and thus the above-mentioned control device is operated unreliably. Japanese Laid-Open Patent Application No. 63-15437 discloses that a plurality of rotary shafts are provided between the compressor rotor and the rotary compressor, and the rotary shafts are connected to one another via pulleys and timing belts, and the rotary shafts and the compression mechanism are driven by a belt. However, in this connection structure, even if the output of the split beam dynamo is adjusted so that the compression mechanism operates at a constant speed, the rotating speed of the rotary compressor will be changed in accordance with the fluctuation of the tension in the winding of the armature coil of the split beam 3da54e8ca3
