A storage system may include a plurality of storage devices and may store a plurality of data blocks. In order to guarantee the reliability of data stored in the storage system, a storage device may need to copy data stored in a local storage to another storage device. When multiple storage devices are included in the storage system, a data block may be copied from one storage device to another storage device by use of a1d647c40b

Start Autocad on your computer. Click on Autocad menu and then choose File > New. In the New page choose the option Automated. Enter a filename, choose a directory where you want to store the model and then click on OK. At this point you should be ready to export the model, open the exported file and then paste it in the Autocad drawing. If you get an error try installing the latest Autocad version, sometimes older versions of Autocad have a problem with the Autocad Runtime Licensing Controller. If you still have issues try trying it with a newly created model in the same folder as the one you are using. Another option is to try the Autocad SDK, the Autocad SDK is not the same application as Autocad but it will let you create your own models. Do NOT use the cracked version of the Autocad SDK as the cracked version is usually just a copy of the original. Let me know if this was helpful or if you need more help. 1. Field of the Invention The present invention relates to a power connector and more particularly to a power connector that is able to receive large current.

2. Description of Related Art A conventional power connector usually includes an insulated housing, a plurality of power terminals, and a shield member. The insulated housing includes a front side and a rear side opposite to each other, a rear portion located at the rear side, a middle portion and a base portion located between the rear portion and the middle portion. The power terminals are respectively mounted to the rear portion, the middle portion and the base portion of the insulated housing. The shield member includes a body portion located in the rear portion of the insulated housing, a pair of arm portions extending from a lateral side of the body portion, and a pair of solder portions respectively mounted to the arm portions. The pair of arm portions are respectively mounted to the arm portions of the power terminals. However, the power terminals are respectively mounted to the insulated housing through the solder portions and the arm portions, thereby the assembly process of the power connector is very complicated, and the soldering process is difficult to control. Furthermore, the solder portions are located in the rear portion, and the arm portions are located in the middle portion and the base portion, thereby the arm portions and the
